## Question 2

Prove that $1^3 + 2^3 + \cdots + n^3 = (1 + 2 + \cdots + n)^2$ for all $n \in \mathbb{N}$.

### Response

*Proof.* Let $P_n$ read "$1^3 + 2^3 + \cdots + n^3 = (1 + 2 + \cdots + n)^2$ for all $n \in \mathbb{N}$".

***Base case:*** $P_1$ reads "$1^3 = 1^2$". Clearly, $1 = 1$ so $P_1$ holds true.

***Inductive Hypothesis:*** Assume $P_n$ holds true for an arbitrary $n \in \mathbb{N}$. We want to show that $P_{n+1}$ is true.

$$\begin{aligned}
1^3 + 2^3 + \cdots + n^3 + (n+1)^3 &= (1^3 + 2^3 + \cdots + n^3) + (n+1)^3 \\
&= (1 + 2 + \cdots + n)^2 + (n+1)^3 && \text{from } P_n \\
&= \left(\frac{n(n+1)}{2}\right)^2 + (n+1)^3 && \text{from class, we proved that } \sum_{i=1}^{n} i = \frac{n(n+1)}{2} \\
&= \frac{n^2(n+1)^2}{4} + (n+1)^3 \\
&= \frac{1}{4}\left[n^2(n+1)^2 + 4(n+1)^3\right] \\
&= \frac{1}{4}\left[(n+1)^2(n^2 + 4(n+1))\right] \\
&= \frac{1}{4}\left[(n+1)^2(n^2 + 4n + 4)\right] \\
&= \frac{1}{4}\left[(n+1)^2(n+2)^2\right] \\
&= \frac{(n+1)^2(n+2)^2}{4} \\
&= \left(\frac{(n+1)(n+2)}{2}\right)^2 \\
1^3 + 2^3 + \cdots + n^3 + (n+1)^3 &= (1 + 2 + \cdots + n + (n+1))^2 && \text{from class, we proved that } \frac{n(n+1)}{2} = \sum_{i=1}^{n} i
\end{aligned}$$

By the principle of mathematical induction, since we proved that $P_{n+1}$ holds true for an arbitrary $n \in \mathbb{N}$, $P_n$ holds true for all $n \in \mathbb{N}$. □

## Question 6 part (b), (e), (f)

Let $(\mathbb{F}, +, \cdot, \leq)$ be an ordered field (not necessarily $\mathbb{Q}$ or $\mathbb{R}$!) and for any $x \in \mathbb{F}$, define

$$|x| = \begin{cases} x & \text{if } x \geq 0 \\ -x & \text{if } x < 0 \end{cases} \tag{1}$$

This is called the *absolute value* function. Notice that $|x| \geq 0$ for every $x \in \mathbb{F}$.

(b) Let $a \in \mathbb{F}$ such that $a \geq 0$. Show that for $x, y \in \mathbb{F}$, $|x - y| \leq a$ if and only if $y - a \leq x \leq y + a$.

(e) Let $x, y \in \mathbb{R}$. Prove that if for any $\varepsilon > 0$, $x \leq y + \varepsilon$, then $x \leq y$. Show that we can also replace $x \leq y + \varepsilon$ with $x < y + \varepsilon$ and obtain $x \leq y$.

(f) Let $x, y \in \mathbb{R}$. Prove that $x = y$ if and only if for any $\varepsilon > 0$, we have $|x - y| < \varepsilon$.

### Response

(b) *Proof.* $\implies$ There are two cases:
***Case I:*** $0 \leq x - y$. Then, $|x - y| = x - y$, so

$$\begin{aligned} x - y &\leq a \\ x &\leq y + a \end{aligned}$$

***Case II:*** $x - y < 0$. Then, $|x - y| = -(x - y) = y - x$, so

$$\begin{aligned} y - x &\leq a \\ x &\geq y - a \end{aligned}$$

so, we have that $y - a \leq x \leq y + a$.

$\impliedby$ There are two cases:
***Case I:*** $x \leq y + a$. Note that if $0 \leq x - y \implies |x - y| = x - y$.

$$\begin{aligned} x &\leq y + a \\ a &\geq x - y \\ a &\geq |x - y| \end{aligned}$$

***Case II:*** $y - a \leq x$. Note that if $x - y < 0 \implies |x - y| = -(x - y)$.

$$\begin{aligned} y - a &\leq x \\ a &\geq y - x \\ a &\geq -(x - y) \\ a &\geq |x - y| \end{aligned}$$

So, $|x - y| \leq a$.

In both cases, we have that $|x - y| \leq a$. Therefore, $|x - y| \leq a \iff y - a \leq x \leq y + a$. $\square$

(e) *Proof.* Assume by contradiction that $y < x$. Then, $0 < x - y$. Fix $\varepsilon = \frac{1}{2}(x - y)$. Clearly, $0 < \frac{1}{2}(x - y)$ from our assumption. Then,

$$\begin{aligned} \frac{1}{2}(x - y) &< x - y \\ \varepsilon &< x - y \end{aligned}$$

which is a contradiction to the statement that $x - y \leq \varepsilon$. Therefore, if for any $\varepsilon > 0$, $x \leq y + \varepsilon$, then $x \leq y$. $\square$

*Proof.* Assume by contradiction that $y < x$. Then, $0 < x - y$. Fix $\varepsilon = \frac{1}{2}(x - y)$. Clearly, $0 < \frac{1}{2}(x - y)$ from our assumption. Then,

$$\begin{aligned} \frac{1}{2}(x-y) &< x - y \\ \varepsilon &< x - y \end{aligned}$$

which is a contradiction to the statement that $x - y < \varepsilon$. Therefore, if for any $\varepsilon > 0$, $x < y + \varepsilon$, then $x \leq y$. $\square$

(f) *Proof.* $\implies$ Let $x = y$. We want to prove that $|x - y| < \varepsilon$. $x = y \implies x - y = 0$. Then, $|x - y| = |0| = 0$ by definition of the *absolute value* function. Substituting $|x - y| = 0$, we get $|x - y| < \varepsilon = 0 < \varepsilon$. Clearly, for any $\varepsilon > 0$, $0 < \varepsilon$ holds true.

$\impliedby$ Assume by contradiction that $x \neq y$. Then, $0 \leq |x - y|$ by definition of the *absolute value* function. Now take $\varepsilon = \frac{1}{2}|x - y|$. Clearly, $0 < \frac{1}{2}|x - y| < |x - y|$. Then, we have $\frac{1}{2}|x - y| < |x - y| \implies \varepsilon < |x - y|$, which is a contradiction to the statement for any $\varepsilon > 0$, $|x - y| < \varepsilon$. $\square$

## Question 13 part (a)

Assume $\alpha \in \mathbb{R}$ is an upper bound for a set $A \subseteq \mathbb{R}$, which is a non-empty and bounded above. Prove that $\alpha = \sup A$ if and only if for every $\varepsilon > 0$, there exists an $a \in A$ such that $\alpha - \varepsilon \leq a$.

### Response

*Proof.* $\implies$ Let $\alpha = \sup A$. Assume by contradiction that $\exists \varepsilon > 0$ such that $\forall a \in A$, we have $a < \alpha - \varepsilon$. Then $\alpha - \varepsilon$ is an upper bound for $A$. But $\alpha - \varepsilon < \alpha$, which is a contradiction to the statement that $\alpha$ is the *least* upper bound for $A$. Therefore, $\forall \varepsilon > 0, \exists a \in A$ such that $\alpha - \varepsilon \leq a$.

$\impliedby$ Assume $\forall \varepsilon > 0$, there exists some $a \in A$ such that $\alpha - \varepsilon \leq a$. Assume by contradiction that $\alpha \neq \sup A$. Since $\sup A$ is the least upper bound for $A$, we have that $\sup A < \alpha$ since $\alpha$ is an upper bound by the problem statement. Then by the density of $\mathbb{R}$, we have that $\sup A < x < \alpha$. Let $\varepsilon = \alpha - x$. Then $\alpha - (\alpha - x) \leq a \implies x \leq a \implies \sup A < x \leq a$ which is a contradiction to the statement that $\sup A$ is a supremum for $A$. Therefore, $\alpha = \sup A$. $\square$

## Question 14

Assume that $A, B$ are nonempty subsets of $\mathbb{R}$ that are bounded above and $A \subseteq B$. Show that $\sup A \leq \sup B$.

### Response

*Proof.* Note that $B \subseteq \mathbb{R}$, it is non-empty, and it is bounded above. Therefore, by definition of the supremum, $\sup B$ exists. We now want to show that $\sup A$ exists. Since $A \subseteq B$, by the transitive property of the subset relation, $A \subseteq \mathbb{R}$. By the problem statement, $A$ is also non-empty and bounded above. Therefore, by definition of the supremum, $\sup A$ exists. Note that since $A \subseteq B$, we have $\forall a \in A,\ a \in B \implies \forall a \in A,\ a \leq \sup B$. So, $\sup B$ is an upper bound for $A$. Since $\sup A$ is the *least* upper bound for $A$, by the definition of the supremum, $\sup A \leq \sup B$. $\square$
